Final project content and inspiration

Website designing is always very clean and simple to let users quickly find what the user needs in this website. However on my website, I try to add the messy, and funny material insides. Just like combining two opposite things on the same page. For the next part, it is about my inspiration and ideas of creating this website. Then it is the websites content and technical process, skills I used for creating. The last part is the artist statement of this artwork.

As the website's name is "Wrose Website" but I believe it is not the much worse, I referen Bootstrap websites to make three rows and each row have different points, the center row is essential for content, it has many GIFs images to create each short event in this website. That also is the technical of designing a website. As creating a website, coding should be the most important part, programming language can help designer type codes to create those effects and content. Expect W3school and getBootstrap these professional website coding, I also learn from many personal answers from other people when I research online. There are some new codings I learned and I used in designing my website: CSS transforms two dimensions; Border setting; Audio control; Icon; and Hidden image.

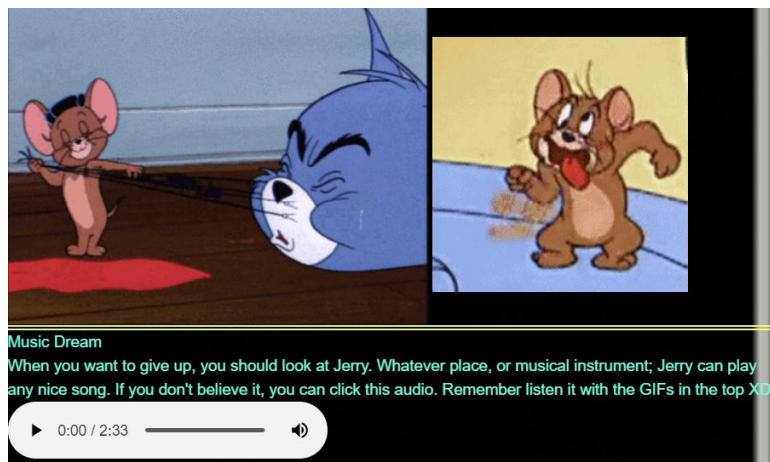

```

11 <script type="text/javascript">
12 function f1(clickid){
13 if(document.getElementById(clickid).style
   .display=='none'){
14 document.getElementById(clickid).style.
   display='block'
15 }
16 else{
17 document.getElementById(clickid).style.
   display='none'
18 }
19 }
20 </script>

```

They are not very hard, only the hidden image needs to set up a function with javascript then the website would run this function. Most others codes just need to change some contents of the coding and many things would not be changed. My first inspiration is from when I

researched some information and opened a website it would have so many advertisements make the website look very worse. The advertisements would occlude the content and it would be very easy to open the advertisement's website. Therefore my website also adds many advertisements' images to make the worse effect. My second inspiration is from the funny websites and social media that saw people post the funny images that I really thankful for "Tom & Jerry" this famous animation, I could find many funny GIFs from this animation. Overall it is not too hard work, and I hope

audiences can enjoy it. The one thing I really like in my website is the audio part, that is guitar music and I choose two GIFs very fit on this audio.

Artist statement: For this final project assignment, it is a conclusion about what I learn of the websites designing in this class. I choose to create a website because I think programming is very challenging me and it is a very logical way to do something. If some parts of the code do not work to show the effect I want, I need take a long time to find the mistakes. I don't have my own art style or aesthetic yet, so it is not a very special artwork if compared with other websites. However I believe art has so many ways to embody it, it can be very simple or complex. My goal of this project is every audience does not need to think about during their opening this website just enjoy what they see.

I do not have that much experience of typing codes, after learning how to create the html file and many basic coding of html, I still need to find many references of code to help me complete this website. When I opened other websites they also would give me some inspiration for creating. The hardest part is to create the organization for the websites, it needs to set many codes for running. For the color, I also choose darkness and lightness color to make the reflection, that might not be comfortable for audiences, but that is the effect I want. I also try to add more content or effect to make websites better but I also worry that it would affect other codes, therefore each time I try a new code, I would create a practice website to practice this code then add into the website. I also want to learn more scripting languages that create a more funny website in the future.

I believe this project still has so many things that can develop better, as a website, through the color, space or any other material it can be an artwork.
